

Statement on PFAS

(Per- and polyfluorinated alkyl substances)

PFAS are a group of industrial chemicals that includes a large number of substances. These are organic compounds in which the hydrogen atoms are completely (“perfluorinated”) or partially (“polyfluorinated”) replaced by fluorine atoms. Due to their special properties, they have been widely used in many industrial sectors for a long time.

PFAS are used specifically because of their water- and fat-repellent properties as well as their stability and longevity (persistence). However, many PFAS are toxic, accumulate through the food chain, or are mobile. Once released into the environment, all PFAS are hardly to remove.

The best-known PFAS substance groups are:

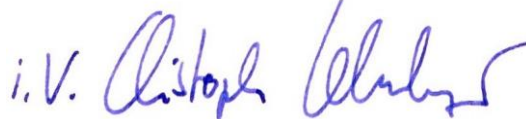

- perfluoro octane sulfonic acid (PFOS)
- perfluoro octanoic acid (PFOA)

PTFE (polytetrafluoroethylene, known as “Teflon”) is not a PFAS.

We declare that ANDUS does not use PFAS in production and is not present in any of its products.
